A/B Testing using Python

INTRO

A/B Testing means analyzing two marketing strategies to choose the best marketing strategy that can convert more traffic into sales (or more traffic into your desired goal) effectively and efficiently

Your goal can be to boost sales, followers, or traffic, but when we choose the best marketing strategy according to the results of our previous marketing campaigns, it is nothing but A/B testing.

Let's import the necessary Python libraries and both the datasets to get started with the task of A/B testing

Link to datasets: https://statso.io/a-b-testing-case-study/

```
In [1]: Import pandas as pd
import datetime
from datetime import date, timedelta
import plotly.graph_objects as go
import plotly.express as px
import plotly.io as pio
pio.templates.default = "plotly_white"

control_data = pd.read_csv("control_group.csv", sep = ";")
test_data = pd.read_csv("test_group.csv", sep = ";")
```

In [2]: print(control_data.head())

```

4

The datasets have some errors in column names. Let's give new column names before moving forward

Checking for Null Values:

In [5]: ▶ print(control_data.isnull().sum())

Campaign Name 0 Date 0 Amount Spent Number of Impressions Reach 1 Website Clicks 1 Searches Received Content Viewed Added to Cart 1 **Purchases** 1 dtype: int64

```
In [6]: ▶ print(test_data.isnull().sum())
```

```
Campaign Name
                      0
Date
                0
Amount Spent
Number of Impressions
Reach
Website Clicks
                   0
Searches Received
                      0
Content Viewed
                     0
Added to Cart
                   0
Purchases
                   0
dtype: int64
```

The dataset of the control campaign has missing values in a row. Let's fill in these missing values by the mean value of each column:

```
In [7]: In [7]
```

Now I will create a new dataset by merging both datasets:

	Campaign Name	Date /	Amount Spent	Number of Impressions	Reach \
0	Control Campaign	1.08.2019	2280	82702.0 56930.0	
1	Test Campaign	1.08.2019	3008	39550.0 35820.0	
2	Test Campaign	10.08.2019	2790	95054.0 79632.0	
3	Control Campaign	10.08.201	9 2149	117624.0 91257.0	
4	Test Campaign	11.08.2019	2420	83633.0 71286.0	

Website Clicks Searches Received Content Viewed Added to Cart Purchases

0	7016.0	2290.0	2159.0	1819.0	618.0
1	3038.0	1946.0	1069.0	894.0	255.0
2	8125.0	2312.0	1804.0	424.0	275.0
3	2277.0	2475.0	1984.0	1629.0	734.0
4	3750.0	2893.0	2617.0	1075.0	668.0

C:\Users\17742\anaconda3\lib\site-packages\pandas\core\reshape\merge.py:1141: UserWar ning: You are merging on int and float columns where the float values are not equal to their in t representation

warnings.warn(

Before moving forward, let's have a look if the dataset has an equal number of samples about both campaigns:

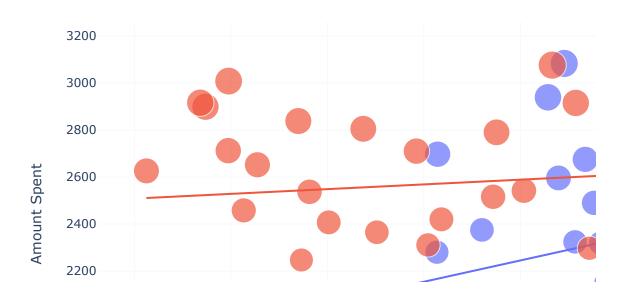

In [9]: print(ab_data["Campaign Name"].value_counts())

Test Campaign 30 Control Campaign 30

Name: Campaign Name, dtype: int64

A/B Testing to Find the Best Marketing Strategy

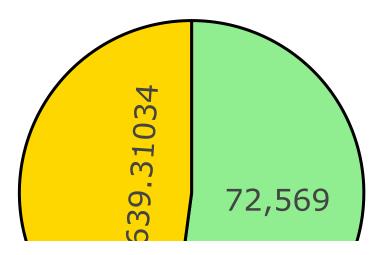

To get started with A/B testing, I will first analyze the relationship between the number of impressions we got from both campaigns and the amount spent on both campaigns:

let's have a look at the number of searches performed on the website from both campaigns:

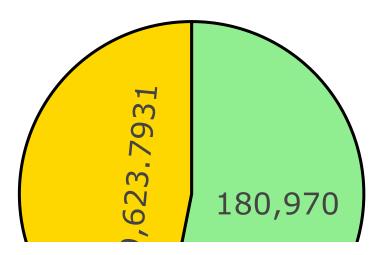

```
In [11]: Image: Image:
```

Control Vs Test: Searches

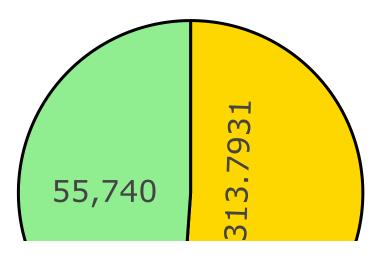

let's have a look at the number of website clicks from both campaigns:

Control Vs Test: Website Clicks

let's have a look at the amount of content viewed after reaching the website from both campaigns

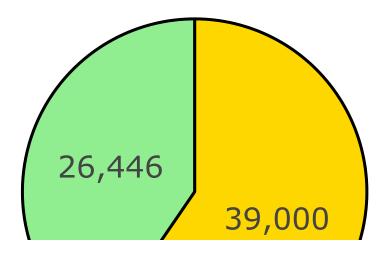

Control Vs Test: Content Viewed

The audience of the control campaign viewed more content than the test campaign. Although there is not much difference, as the website clicks of the control campaign were low, its engagement on the website is higher than the test campaign

Let's have a look at the number of products added to the cart from both campaigns

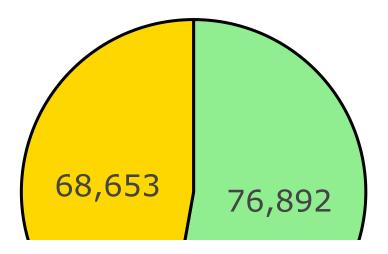

Control Vs Test: Added to Cart

Despite low website clicks more products were added to the cart from the control campaign. Now let's have a look at the amount spent on both campaigns

```
In [15]: Image: Image:
```

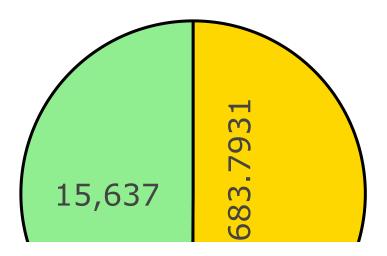

Control Vs Test: Amount Spent

The amount spent on the test campaign is higher than the control campaign. But as we can see that the control campaign resulted in more content views and more products in the cart, the control campaign is more efficient than the test campaign

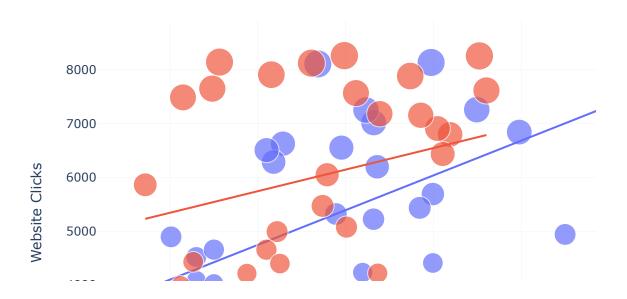

let's have a look at the purchases made by both campaigns

Control Vs Test: Purchases

let's analyze some metrics to find which ad campaign converts more. I will first look at the relationship between the number of website clicks and content viewed from both campaigns

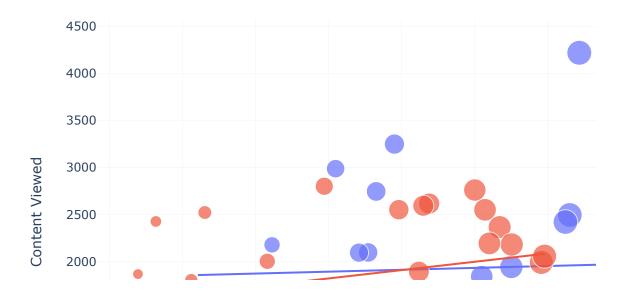

```
In [17]: In
```

The website clicks are higher in the test campaign, but the engagement from website clicks is higher in the control campaign. So the control campaign wins!

Relationship between the amount of content viewed and the number of products added to the cart from both campaigns

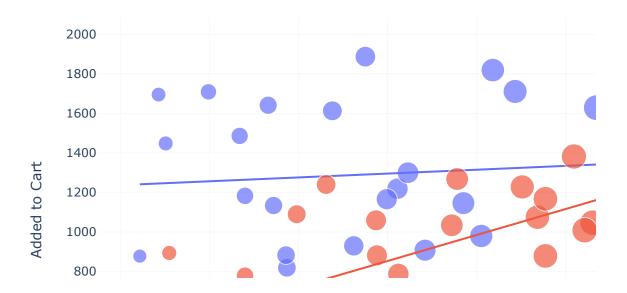

```
In [19]: In
```

Again, the control campaign wins!

Let's have a look at the relationship between the number of products added to the cart and the number of sales from both campaigns

```
In [20]: In
```

Although the control campaign resulted in more sales and more products in the cart, the conversation rate of the test campaign is higher

Conclusion

From the above A/B tests, we found that the control campaign resulted in more sales and engagement from the visitors. More products were viewed from the control campaign, resulting in more products in the cart and more sales. But the conversation rate of products in the cart is higher in the test campaign. The test campaign resulted in more sales according to the products viewed and added to the cart. And the control campaign results in more sales overall. So, the Test campaign can be used to market a specific product to a specific audience, and the Control campaign can be used to market multiple products to a wider audience.
